

You should submit a short report (2-3 pages) containing the following:

What does your system (extension) do?

How did you tackle the task?

Did it work? How well? How do you know? Give some analysis of the system's performance: e.g.

Any evaluation results available

Conclusions from manual inspection of output

Problems that meant you didn't get any satisfactory output

How you might extend or improve the system further if you had more time (or computing resources, or data, ...)

The submission is due one week after the end of the course (plus a weekend): 24.5.2021.

Also submit your code as a single Python file. Don't worry too much about cleaning it up or submitting production-quality code! As with the assignments, we will not mark the code itself – it is only for reference when marking your report.

We will not be grading your submission on the basis of the success of your system. The main purpose of this assignment is for you to have putting into practice what you've learned to gain a better understanding of the challenges of building successful, real-world NLP systems.
